MEDLINE=95370352; PubMed=7642694; DOI=10.1083/jcb.130.4.1005; Koch M., Bohrmann B., Matthison M., Hagios C., Trueb B., Chiquet M "Large and small splice variants of collagen XII: differential expression and ligand binding.";
J. Cell Biol. 130:1065-1014(1995).
-i- FUNCTION: Type XII collagen interacts with type I collagen-containing fibrils, the COLI domain could be associated with the surface of the fibrils, and the COL2 and NC3 domains may be localized in the perifibrilar matrix.
-i- SUBUNIT: Trimer of identical chains each containing 190 kDa of nontriple-helical sequences.
-i- ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TISSUE-Embryo;

IsoId=P13944-2; Sequence=VSP 001148;
TISSUE SPECIFICITY: Type XII collagen is present in tendons,
                                                                                                                                                          ligaments, perichondrium, and periosteum, all dense tissues containing type I collagen.

DOMAIN: This sequence defines five distinct domains, helical domains (COL1 and COL2) and three nontriple-domains (NC1, NC2, and NC3).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Event=Alternative splicing; Named isoforms=2;
Comment=The final tissue form of collagen XII may contain
homotrimers of either isoform Long or isoform Short or any
combination of isoform Long and isoform Short. Only isoform Long
is a proteoglycan. Isoform Long has more restricted expression

-i- FUNCTION: Type XII collagen interacts with type I collagen-containing fibrils, the COL1 domain could be associated with the surface of the fibrils, and the COL2 and NC3 domains may be localized in the perifibrillar matrix (By similarity).

-i- SUBUNIT: Trimer of identical chains each containing 190 kDa of nontriple-helical sequences.

-i- ALTERNATIVE PRODUCTS:
Event-Alternative splicing; Named isoforms-2;
Comment-The final tissue form of collagen XII may contain homotrimers of either isoform Long or isoform Short or any combination of isoform Long and isoform Short;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      unit (G-X-Y) are hydroxylated in some or all of the chains similarity).

PTM: O-glycosylation of isoform Long; glycosaminoglycan chondroitin-sulfate type (By similarity).

SIMILARITY: Belongs to the fibril-associated collagens winterrupted helices (FACIT) family.

SIMILARITY: Contains 18 fibronectin type-III domains.

SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.

SIMILARITY: Contains 4 VWFA domains.

                                                                                                                                                                                                                                                                                                                              "Structural variation of type XII collagen at its carboxyl-terminal NC1 domain generated by tissue-specific alternative splicing.";
J. Biol. Chem. 274:22053-22059(1999).
-i- FUNCTION: Type XII collagen interacts with type I collagen containing fibrils, the COL1 domain could be associated with the surface of the fibrils, and the COL2 and NC3 domains may be localized in the perifibrillar matrix (By similarity).
-i- SUBUNIT: Trimer of identical chains each containing 190 kDa of nontriple-helical sequences (By similarity).
-i- ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE=99348349; PubMed=10419532; DOI=10.1074/jbc.274.31.22053; Kania A.M., Reichenberger E., Baur S.T., Karimbux N.Y., Taylor R Olsen B.R., Nishimura I.;

DEVELOPMENTAL STAGE: The long NC3 XIIA isoforms are predominant a early-stages (ED7 and 11); at later stages of development (ED15 and 17) the short NC3 XIIB forms become the major forms. As the short NC3 forms become the major product, the long splice variant continues to be expressed in several tissues, even after birth.
                                                                                                                                                                                                                                                                         Event-Alternative splicing; Named isoforms=4;
Event-Alternative splicing; Named isoforms=4;
Comment=The final tissue form of collagen XII may contain
Comment-rimers or any combination of the various isoforms;

SIMILARITY: Belongs to the fibril-associated collagens with interrupted helices (FACIT) family.

SIMILARITY: Contains 18 fibronectin type-III domains.

SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.

SIMILARITY: Contains 4 VWFA domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The long NC1 isoforms, XIIA-1 and XIIB-1, peak in 15-day old embryos and decrease in 17-day old ones. The expression of the short NC1 form XIIB-2 remains constant throughout late stages of embryonic development (ED15 and ED17).

PTM: The triple-helical tail is stabilized by disulfide bonds at each end (By similarity).

PTM: Prolines at the third position of the tripeptide repeating unit (G.X.-Y) are hydroxylated in some or all of the chains (By
